

Helix Comprehensive Pharmacogenomics (PGx) Panel

Item	Description
Test Name	Helix Comprehensive Pharmacogenomics (PGx) Panel
Test Type	Pharmacogenomics
Catalog Number	PCOM1
Procedure Code	79714-2 (LOINC)
Test Description	This test evaluates a patient's metabolizer status for 26 genes, which can aid in appropriate medication selection and dosing to reduce risk of side effects and treatment failure for cancer, cardiovascular disease, pain, mental health and other conditions.
Genes Tested	<i>ABCB1, ABCG2, ATIC, COMT, CYP2C cluster, CYP2C19, CYP2C9, CYP2D6, CYP3A4, CYP3A5, CYP4F2, DPYD, F2, F5, GRK4, HLA-B, IFNL3, IFNL4, MT-RNR1, MTHFR, NUDT15, OPRM1, SLC19A1, SLCO1B1, TPMT, VKORC1</i>
Genetics Information	This test utilizes next-generation sequencing to determine star alleles and metabolizer status for <i>ABCB1, ABCG2, ATIC, COMT, CYP2C cluster, CYP2C19, CYP2C9, CYP2D6, CYP3A4, CYP3A5, CYP4F2, DPYD, F2, F5, GRK4, HLA-B, IFNL3, IFNL4, MT-RNR1, MTHFR, NUDT15, OPRM1, SLC19A1, SLCO1B1, TPMT, and VKORC1</i>
Indications For Testing	Patients for whom medication from the following list* are being considered, have been ineffective, or caused side effects: Abacavir, Allopurinol, Amikacin, Amitriptyline, Amphetamine, Aripiprazole, Atomoxetine, Atorvastatin, Azathioprine, Brexpiprazole, Brivaracetam, Capecitabine, Carbamazepine, Celecoxib, Citalopram, Clobazam, Clomipramine, Clopidogrel, Clozapine, Codeine, Desipramine, Deutetrabenazine, Dexlansoprazole, Doxepin, Escitalopram, Flecainide, Flibanserin, Fluorouracil, Flurbiprofen, Fluvastatin, Fluvoxamine, Gefitinib, Gentamicin, Haloperidol, Hydrocodone, Ibuprofen, Iloperidone, Imipramine, Kanamycin, Lamotrigine, Lansoprazole, Lofexidine, Lornoxicam, Lovastatin, Meloxicam, Mercaptopurine, Metoprolol, Nortriptyline, Oliceridine, Omeprazole, Ondansetron, Oxcarbazepine, Pantoprazole, Paroxetine, Peginterferon alfa-2a, Peginterferon alfa-2b, Pimozide, Piroxicam, Pitavastatin, Plazomicin, Pravastatin, Propafenone, Quetiapine, Risperidone, Rosuvastatin, Sertraline, Simvastatin, Streptomycin, Tacrolimus, Tamoxifen, Tegafur, Tenoxicam, Thioguanine, Thioridazine, Tobramycin, Tramadol, Trimipramine, Tropicisetron, Valbenazine, Venlafaxine, Voriconazole, Vortioxetine, and Warfarin
Clinical Descriptions	Many medications are impacted by specific variations in known genes. These genetic variations can contribute to medication efficacy and risk for side effects. Pharmacogenomic testing to guide prescribing, paired with clinical monitoring can impact outcomes for patients by reducing the time to therapeutic effect and reducing the risk of side effects.
Disease States	Cardiovascular, neurovascular, mental health, gastrointestinal, cancer, pain and many other conditions.
Interpretation	All detected variants are evaluated according to the Clinical Pharmacogenetics Implementation Consortium (CPIC). Variants are classified based on known, predicted, or possible impact on drug metabolism.

Helix Comprehensive Pharmacogenomics (PGx) Panel

Item	Description
Reclassification Of Variants	Helix does not systematically review variants evaluated and reported for this test looking for guideline updates or classification changes. Helix will review the classification of previously reported variants upon request of the ordering physician/provider. Ordering physicians/providers may contact Helix Customer Support to request a review of updates to CPIC guidelines and/or variant classification in terms of impact on drug metabolism. At the discretion of the laboratory director, the frequency of reclassification requests may be limited to once per year, no earlier than 12 months after initial evaluation has been performed.
Variant Evaluation	<p>Variant classification is performed using data provided by CPIC whenever available. When CPIC data is not available, a thorough literature search is performed to evaluate whether specific alleles have known and established impact on drug metabolism.</p> <p>Recommendations and interpretation for dosage and prescription are based on guidelines set forth by CPIC, the Food and Drug Administration (FDA), and the Pharmacogenomics Knowledgebase (PharmGKB). Variants are classified as having impact on drug metabolism with the following tiers: poor metabolizer, intermediate metabolizer, normal metabolizer, and ultrarapid metabolizer. These classifications are based on the combination of alleles found in the given individual and data set forth by CPIC and the other entities mentioned above. Variants of unknown significance on drug metabolism are not reported.</p>
Turnaround Time	7 to 10 days
Available In NY State	No
Test Classification	This test was developed, and its performance characteristics determined, by Helix, Inc. in a manner consistent with CLIA requirements. This test has not been cleared or approved by the US Food and Drug Administration.

Methods & Limitations for Helix Comprehensive Pharmacogenomics (PGx) Panel

Data were generated from extracted DNA using the validated Helix Exome+ assay by the Helix clinical laboratory. The Exome+ assay is based on target enrichment followed by next generation sequencing using paired end reads on an Illumina DNA sequencing system. Star alleles were determined using a proprietary algorithm which performs variant calling and then determines star allele solutions based on a combination of defining SNPs and exon-level copy number.

Metabolizer status was determined based on star allele solutions according to CPIC guidelines, with the following exceptions: (1) metabolizer status was set as Indeterminate if a novel nonsense or truncating novel mutation was observed within the gene, (2) metabolizer status was set as Indeterminate if the combination of defining SNPs and copy number suggested a novel star allele solution, and (3) if more than two copies of a gene were detected then metabolizer status was set as Indeterminate. Drug/gene considerations were limited to guidelines published by FDA, CPIC, or PharmGKB.

Phasing could not be performed for genotypes, and therefore in some cases the star allele solution could not be disambiguated between two or more equally likely possibilities. In these cases, if the metabolizer status was the same regardless of possible star allele solutions, the more common star allele solution was provided along with the metabolizer status. If the metabolizer status was different for the equally-likely star allele solutions, the star alleles were reported as Unknown and the metabolizer status was considered Indeterminate.

All samples were sequenced and interpreted in Helix's CLIA-certified (#05D2117342) and CAP-accredited (#9382893) laboratory in San Diego, California. These tests have not been cleared or approved by the U.S. Food and Drug Administration.

Targeted Genes & Methodology for Helix Comprehensive Pharmacogenomics (PGx) Panel

The following applies to the Helix Pharmacogenomics Comprehensive (PGx) Panel. Next-generation sequencing is performed to test for the presence of star allele solutions in the genes analyzed, according to the reportable range listed.

This list is current from January 2025 to the present. For questions regarding genes, reference transcripts, or specific regions covered, contact Helix Customer Service at (844) 211-2070.
